Imagine I asked you to remove the red sharpie marker from the left hand side?

- Difficulty finding it
- Could dive right in, but might get poked by lot of sharp things on the way in
- Or you could dump everything out and start all over

# Why Git?

- There are multiple GUIs available for Git, such as one from GitHub called the **GitHub Desktop**. We will not be using this for religious perfectly scientific reasons.
- These reasons primarily revolve around flexibility and improved understanding of the Git tools.
- Everything we do will be usable on Deigo.
- The **Pro Git** book is available online at [git-scm.com/book](http://git-scm.com/book)
- There is a cheatsheet for Git available here: <https://www.git-tower.com/learn/cheatsheets/git>

- I personally struggled with the terminal interface at first because most of the man pages use so much vocab I don't know to explain terms I don't know. Hopefully by the end of this mini-course you'll have the basic vocab down so you can help yourselves more efficiently going forward.

# What is git?

- A **Working Directory**: Just a folder where your files are
- A **Staging Area**: A place to organize what exactly you want to version and what you don't
- A **Repository**: Where the magic happens.

#### └ What is git?

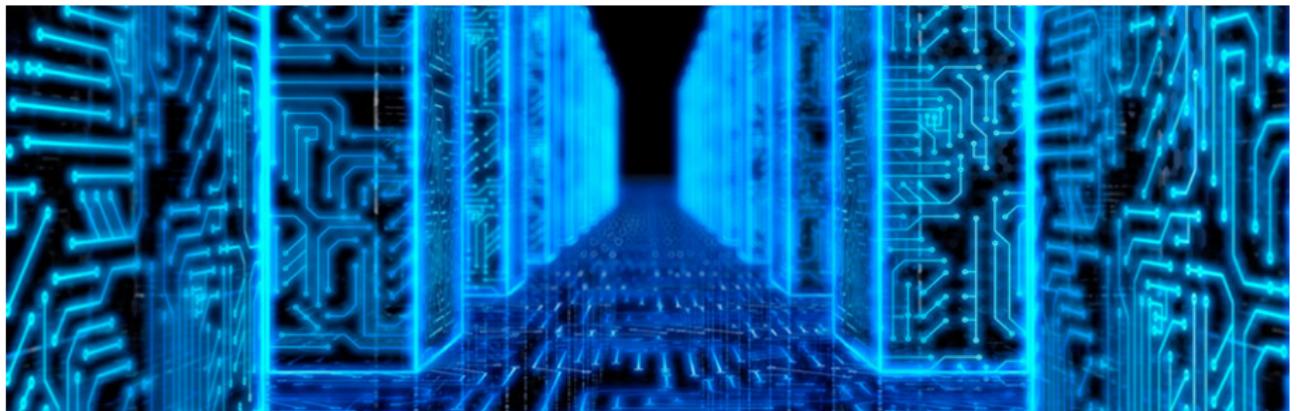

This chart might not make much sense now, but I hope it will before the end of these slides

Whether you realize it or not, you are already familiar with the "Working Directory". I'll save the staging area for a bit later, but first lets talk about what a repo is.

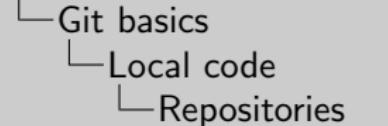

# Repositories

- A **repository** is a container for both your project data and all the items that allow interactions with git commands.
  - There are many sites to host your repository on (github, bitbucket), including your own local machine.
  - All of the essential parts of your repository can be found in the `.git` directory
  - GitHub (a website hosting Git repositories)  $\neq$  Git (a set of tools for creating and managing those repositories).

# Create a Repo(sitory)

Let's **git** started.

- To initialize a git repository, simply type **git init** in a directory (preferably empty for now)
- This creates a folder **.git/**, where all your repository information is held.

# Quick Exercise

## EXERCISE

- ① Open a terminal
- ② Create a new directory called **myFirstRepo** and enter it.
- ③ This is your Working Directory. Thats it!
- ④ Run **git init** in your Working Directory.
- ⑤ Take a peak in the newly created .git directory but don't touch anything quite yet.

# Commits

- Conceptually similar to "versions"
- The more effort you put into crafting these using the **staging area** the more helpful they are in the future.

Before we talk about the Stage we need to understand what commits are.  
Show logo photos now

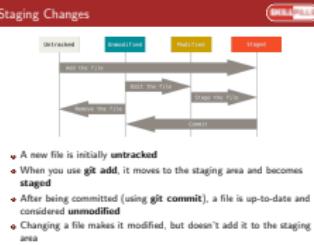

# Staging Changes

- A new file is initially **untracked**
- When you use **git add**, it moves to the staging area and becomes **staged**
- After being committed (using **git commit**), a file is up-to-date and considered **unmodified**
- Changing a file makes it modified, but doesn't add it to the staging area

Go through car repo example, e.g. adding wheels and doors, but committing only one or the other.

# Currrating the Stage before Committing

- Check what is on the stage with **git status**. Anything in **green** is staged.
- If you wish to unstage all changes, simply type **git reset**. This will remove everything from the stage, but keep your working directory untouched.
- **git reset** will work for individual files as well

---

```
git reset <file>
```

As you saw a few slides ago. Adding messy or unnecessary commits doesn't help anyone. Lets discuss how to make meaningful helpful commits using the stage. There are various ways to fix bad commits, but it takes a whole lot less work to do it right the first time.

# Try out the Stage

## EXERCISE

- ① Create a new empty file **myfile.txt**
- ② Check the status of everything with **git status**
- ③ Add **myfile.txt** to the stage via **git add myfile.txt**
- ④ Check the status of everything again with **git status**. What changed?
- ⑤ Unstage the changes with **git reset myfile.txt**
- ⑥ Check the status of everything again with **git status**. What changed?

- Git keeps track of **commits**. Check these commits with **git log**.  
There's plenty of options to show only what you want or everything under the sun.
- **git status** checks any changes since the last commit.
- **git commit** commits everything in the *staging area* - git status shows these files in **green** by default.

- ① Reopen your **myFirstRepo** from before
- ② Add the **myFile.txt** back to the stage with **git add myFile.txt**
- ③ Check the status of the stage with **git status**
- ④ Once satisfied with what is in the stage and you're ready to commit, go ahead and do so with **git commit** to add your new file to the git repository. Be sure to add a meaningful commit message!
- ⑤ Check the **git log**.
- ⑥ Check the **git status**
- ⑦ Add a line of text to **myFile.txt** and save it.
- ⑧ Check the status of the stage with **git status**
- ⑨ Check the differences in the file with **git diff**
- ⑩ Once satisfied with your changes, add it back to the stage and commit.

- ➑ Check the status of the stage with **git status**
- ➒ Check the differences in the file with **git diff**
- ➓ Once satisfied with your changes, add it back to the stage and commit.

# Checking out your past commits

- **git checkout** allows you to view the repository at any commit (found with **git log**).

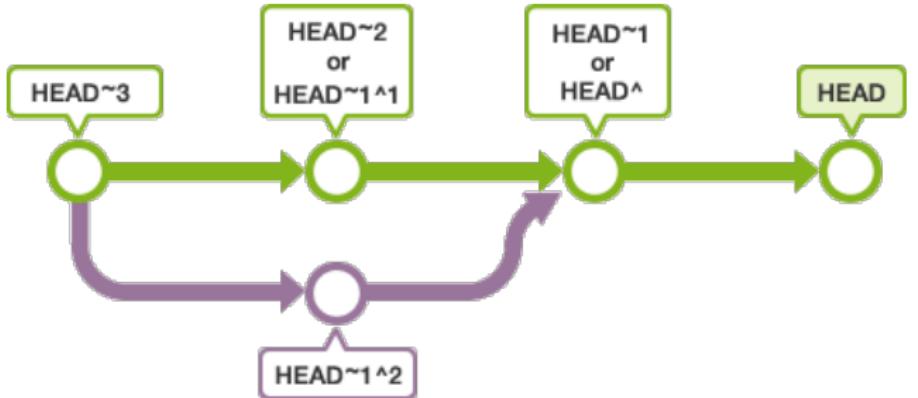

- You may also checkout specific files like so:

---

```
git checkout a1e8fb5 hello.py
```

---

- Note that the most recent commit is **HEAD** and the one just before that is **HEAD~1**

- ③ Once satisfied with what is in the stage and you're ready to commit, use **git commit** to add your new file to the git repository.
- ④ Check the **git log**. You should have three commits by now.
- ⑤ Go checkout each of the commits with **git checkout <HASH>**, **git checkout HEAD~1**, or **git checkout HEAD~2**
- ⑥ See whats different with **ls -al** or **git status** or just open **myfile.txt** in your favorite text editor
- ⑦ When you are satisfied that your commit history is as expected you can return to the most recent commit with **git checkout master** (Note this could be **git checkout main** depending on your version of git.)

# Git Generally Only Adds

- After you commit something it is fairly difficult to remove it.
- This is a double edged sword. Low risk of losing anything permanently. High risk of creating a **HUGE** repo.
- Keep your repository clean! Do your best to commit as few images and data files as possible!
- You can do this by ignoring certain file extensions in a **.gitignore** file.
- Great templates for projects of many types found at  
<https://github.com/github/gitignore>

---

```
# Example gitignore configuration
```

```
*.log  
*.tar  
*.gz

# git with it!

Now we move to the fun\* stuff: working with **online repositories**.

- For this, we will be using **github**.
- We'll begin by creating a GitHub repository using the website.
  - If we're working on a project that's already hosted on a remote Git server, we can skip this step.
- Next, we use **git clone** to download a copy.
- From here, you can do the following:
  - **git push** to push any changes you may have to the online repository.
  - **git pull** to take any changes from the repository.

\*Here, the word *fun* is subject to interpretation.

- It's also great even if you don't collaborate!
- Whenever you are using git, think about other people and how they will perceive your comments. **Would you be able to understand your own cryptic commit messages?**
- You will make mistakes. Don't worry about it. Your entire history is backed up already. Learn from your mistakes and don't make them again!
- Read error messages carefully - they can be useful/informative/instructive.

## (If Time Allows) Modifying Previous Commits

- If you commit something that turns out to be a mistake, don't worry!  
There are plenty of tools to rework commits.
- Some are more powerful (and potentially destructive than others)
- Non-destructive: (Leaves history intact)
  - **revert**
